Water Treatment Control  
of Algae and Bacteria

**AG WATER CHEMICAL**  
Water Treatment Services

# AgriTec™ 2

## Control of Algae and Bacteria for Irrigation

Maintain your irrigation  
uniformity by preventing  
contamination and growth of  
algae and bacteria in reservoirs,  
canals and drip irrigation systems.

Reservoir contaminated  
with algae before  
treatment with **AgriTec™ 2**.

Algae-free reservoir  
after treatment  
with **AgriTec™ 2**.

**AgriTec™ 2** is the most effective copper product utilized to control contamination of irrigation water due to algae and bacteria growth. **AgriTec™ 2** is extremely flexible and is registered for maintenance of drip irrigation systems, reservoirs and canals.

- Release of cupric ion based on biological demand, as opposed to water conditions, provides higher effectiveness, this translates to lower application rates than other copper products.
- Effective in high pH conditions.
- Self-dispersing agents allow for even distribution in reservoirs and canals without spraying or agitation.
- No re-entry restrictions to field after treatment.
- Maintains the efficiency of your drip system to ensure uniform application of water and nutrients saving energy and water.
- Full utilization of water and energy by maintaining irrigation system efficiency.

When used at the recommended rates, **AgriTec™ 2** helps maintain the efficiency of drip irrigation systems. Plugging and contamination reduce system uniformity and have an impact on the quantity of water applied to meet crop demands. Maximize water and nutrient utilization by ensuring high irrigation system efficiencies with **AgriTec™ 2**.
